## Description

graph dot draws horizontal dot charts. In a dot chart, the categorical axis is presented vertically, and the numerical axis is presented horizontally. Even so, the numerical axis is called the $y$ axis, and the categorical axis is still called the $x$ axis:
. graph dot (mean) numeric_var, over (cat_var)

The syntax for dot charts is identical to that for bar charts; see [G-2] graph bar.
We use the following words to describe a dot chart:

The above dot chart contains four lines. The words used to describe a line are

## Quick start

Dot graph showing the mean of v1
graph dot v1
Same as above, with dots for the means of v1 and v2 on a single line graph dot v1 v2

Same as above, but with dots for the means of v1 and v2 on separate lines graph dot v1 v2, ascategory

Same as above, with dots showing the means of v1 and v2 for each level of categorical variable catvar1
graph dot v1 v2, over(catvar1)
Include missing values of catvar1 as their own category
graph dot v1 v2, over(catvar1) missing
Dot graph with dots for each combination of the levels of catvar1 and catvar2 for levels of catvar1 grouped by levels of catvar2
graph dot v1 v2, over(catvar1) over(catvar2)
Same as above, but with levels of catvar2 grouped by levels of catvar1
graph dot v 1 , over(catvar2) over(catvar1)
Dots for the medians of v1 and v2 for each level of catvar1
graph dot (median) v1 v2, over (catvar1)
A separate graph area for each dot graph of the mean of v 1 in groups defined by levels of catvar2 graph dot v1, by(catvar2)

Same as above, but with dots for each level of catvar1 within each graph area
graph dot v1, over(catvar1) by (catvar2)
Dot graph of the sums of v1 and v2 for each level of catvar1
graph dot (sum) v1 v2, over (catvar1)
Same as above, but show the mean and median of v 1
graph dot (mean) v1 (median) v1, over (catvar1)
Change the label of v1 and v2 to "Variable 1" and "Variable 2" in the legend
graph dot v1 v2, over(catvar1) legend(label(1 "Variable 1") ///
label(2 "Variable 2"))

## Menu

Graphics > Dot chart

## Syntax

graph dot yvars $[$ if $][$ in $][$ weight $][$, options $]$
where yvars is
(asis) varlist
or is

$$
\text { (percent) }[\text { varlist }] \mid \text { (count) }[\text { varlist }]
$$

or is

$$
\begin{aligned}
& {[(\text { stat })] \text { varname }[[(\text { stat })] \ldots]} \\
& {[(\text { stat })] \text { varlist }[[(\text { stat })] \ldots]} \\
& {[(\text { stat })][\text { name }=] \text { varname }[\ldots][[(\text { stat })] \ldots]}
\end{aligned}
$$

where stat may be any of
mean median p1 p2 ... p99 sum count percent min max
or

> any of the other stats defined in [D] collapse
$y v a r s$ is optional if the option over (varname) is specified. percent is the default statistic, and percentages are calculated over varname.
mean is the default when varname or varlist is specified and stat is not specified. p1 means the first percentile, p2 means the second percentile, and so on; p50 means the same as median. count means the number of nonmissing values of the specified variable.
options
Description
group_options
yvar_options
linelook_options
legending_options
axis_options
title_and_other_options
groups over which lines of dots are drawn variables that are the dots
how the lines of dots look how yvars are labeled
how numerical $y$ axis is labeled titles, added text, aspect ratio, etc.

Each is defined below.
group_options
Description

| over(varname[, over_subopts]) | categories; option may be repeated <br> nofill |
| :--- | :--- |
| omit empty categories |  |
| missing | keep missing value as category |
| allcategories | include all categories in the dataset |

| yvar_options | Description |
| :--- | :--- |
| ascategory | treat yvars as first over() group |
| asyvars | treat first over() group as yvars |
| per centages | show percentages within yvars |
| calculate yvar statistics omitting missing values of any yvar |  |

linelook_options
Description

| outergap([*]\#) | gap between top and first line and between last line and bottom |
| :---: | :---: |
| linegap(\#) | gap between yvar lines; default is 0 |
| marker (\#, marker_options) | marker used for \#th yvar line |
| pcycle(\#) | marker styles before pstyles recycle |
| linetype (dot \| line $\mid$ rectangle) | type of line |
| ndots(\#) | \# of dots if linetype (dot); default is 100 |
| dots (marker_options) | look if linetype(dot) |
| lines (line_options) | look if linetype(line) |
| rectangles(area_options) | look if linetype(rectangle) |
| rwidth (size) | rectangle width if linetype (rectangle) |
| [no] extendline | whether line extends through plot region margins; extendline is usual default |
| lowextension(size) | extend line through axis (advanced) |
| highextension(size) | extend line through axis (advanced) |

legending_options
Description
legend_options
nolabel
yvaroptions (over_subopts)
showyvars
control of yvar legend use yvar names, not labels, in legend over_subopts for yvars; seldom specified label yvars on $x$ axis; seldom specified
axis_options
Description
yalternate
xalternate
exclude0
yreverse
axis_scale_options
axis_label_options
ytitle(...)
put numerical $y$ axis on right (top)
put categorical $x$ axis on top (right)
do not force $y$ axis to include 0
reverse $y$ axis
$y$-axis scaling and look
$y$-axis labeling $y$-axis titling
title_and_other_options
text (...)
yline(...)
aspect_option
std_options
by (varlist, ...)

Description
add text on graph; $x$ range $[0,100]$
add $y$ lines to graph
constrain aspect ratio of plot region
titles, graph size, saving to disk
repeat for subgroups

The over_subopts-used in over(varname, over_subopts) and, on rare occasion, in yvaroptions(over_subopts) -are
over_subopts
relabel (\# "text" ...)
label(cat_axis_label_options)
axis(cat_axis_line_options)
$\operatorname{gap}([*] \#)$
sort (varname)
sort(\#)
sort ((stat) varname)
descending

## Description

change axis labels
rendition of labels
rendition of axis line
gap between lines within over() category
put lines in prespecified order
put lines in height order
put lines in derived order
reverse default or specified line order
aweights, fweights, and pweights are allowed; see [U] 11.1.6 weight and see note concerning weights in [D] collapse.

## Options

Options are presented under the following headings:

```
group_options
yvar_options
linelook_options
legending_options
axis_options
title_and_other_options
Suboptions for use with over() and yvaroptions()
```

## group_options

over (varname [, over_subopts]) specifies a categorical variable over which the yvars are to be repeated. varname may be string or numeric. Up to two over () options may be specified when multiple yvars are specified, and up to three over()s may be specified when one yvar is specified; options may be specified; see Appendix: Examples of syntax below.
nofill specifies that missing subcategories be omitted. For instance, consider

```
. graph dot (mean) y, over(division) over(region)
```

Say that one of the divisions has no data for one of the regions, either because there are no such observations or because $y==$. for such observations. In the resulting chart, the marker will be missing:

|  | Division 1 | . . . . . . . . . $0 . . .$. |
| :---: | :---: | :---: |
| Region 1 | Division 2 | . 0. |
|  | Division 3 | . . . . . $0 . . . . . . .$. |
|  | Division 1 | . 0. |
| Region 2 | Division 2 |  |
|  | Division 3 | . 0. |

If you specify nofill, the missing category will be removed from the chart:

|  | Division 1 | .o. |
| :---: | :---: | :---: |
| Region 1 | Division 2 | . .o. |
|  | Division 3 | . . 0. |
| Region 2 | Division 1 | . . |
|  | Division 3 | . 0 |

missing specifies that missing values of the over() variables be kept as their own categories, one for ., another for .a, etc. The default is to ignore such observations. An over() variable is considered to be missing if it is numeric and contains a missing value or if it is string and contains "".
allcategories specifies that all categories in the entire dataset be retained for the over() variables. When if or in is specified without allcategories, the graph is drawn, completely excluding any categories for the over() variables that do not occur in the specified subsample. With the allcategories option, categories that do not occur in the subsample still appear in the legend, but no markers are drawn where these categories would appear. Such behavior can be convenient when comparing graphs of subsamples that do not include completely common categories for all over () variables. This option has an effect only when if or in is specified or if there are missing values in the variables. allcategories may not be combined with by().

## yvar_options

ascategory specifies that the yvars be treated as the first over() group.
When you specify ascategory, results are the same as if you specified one yvar and introduced a new first over () variable. Anyplace you read in the documentation that something is done over the first over () category, or using the first over () category, it will be done over or using yvars.

Suppose that you specified

The results will be the same as if you typed
. graph dot $y$, over(newcategoryvariable) whatever_other_options
with a long rather than wide dataset in memory.
asyvars specifies that the first over () group be treated as yvars.
When you specify asyvars, results are the same as if you removed the first over() group and introduced multiple yvars. We said in most ways, not all ways, but let's ignore that for a moment. If you previously had $k$ yvars and, in your first over () category, $G$ groups, results will be the same as if you specified $k^{*} G$ yvars and removed the over(). Anyplace you read in the documentation that something is done over the yvars or using the yvars, it will be done over or using the first over () group.
Suppose that you specified
. graph dot y, over(group) asyvars whatever_other_options
Results will be the same as if you typed
. graph dot y1 y2 y3 ..., whatever_other_options
with a wide rather than long dataset in memory. Variables $y 1, y 2, \ldots$, are sometimes called the virtual yvars.
percentages specifies that marker positions be based on percentages that yvar_i represents of all the yvars. That is,
. graph dot (mean) inc_male inc_female
would produce a chart with the markers reflecting average income.

```
. graph dot (mean) inc_male inc_female, percentages
```

would produce a chart with the markers being located at $100 \times$ inc_male/(inc_male + inc_female) and $100 \times$ inc_female/(inc_male + inc_female).
If you have one yvar and want percentages calculated over the first over() group, specify the asyvars option. For instance,
. graph dot (mean) wage, over( $i$ ) over ( $j$ )
would produce a chart where marker positions reflect mean wages.

```
. graph dot (mean) wage, over(i) over(j) asyvars percentages
```

would produce a chart where marker positions are $100 \times\left(\operatorname{mean}_{i j} /\left(\operatorname{Sum}_{i} \operatorname{mean}_{i j}\right)\right)$
cw specifies casewise deletion. If cw is specified, observations for which any of the $y v a r s$ are missing are ignored. The default is to calculate each statistic by using all the data possible.

## linelook_options

outergap(*\#) and outergap(\#) specify the gap between the top of the graph to the beginning of the first line and the last line to the bottom of the graph.
outergap (*\#) specifies that the default be modified. Specifying outergap (*1.2) increases the gap by $20 \%$, and specifying outergap (*. 8 ) reduces the gap by $20 \%$.
outergap(\#) specifies the gap as a percentage-of-bar-width units. graph dot is related to graph bar. Just remember that outergap(50) specifies a sizable but not excessive gap.
linegap(\#) specifies the gap to be left between yvar lines. The default is linegap(0), meaning that multiple yvars appear on the same line. For instance, typing

```
. graph dot y1 y2, over(group)
```

results in

In the above, o represents the symbol for y 1 and x the symbol for y 2 . If you want to have separate lines for the separate yvars, specify linegap (20):

```
. graph dot y1 y2, over(group) linegap(20)
```

Specify a number smaller or larger than 20 to reduce or increase the distance between the y1 and y2 lines.
Alternatively, and generally preferred, is specifying option ascategory, which will result in

linegap() affects only the yvar lines. If you want to change the gap for the first, second, or third over() groups, specify the over_subopt gap() inside the over() itself.
marker (\#, marker_options) specifies the shape, size, color, etc., of the marker to be used to mark the value of the \#th yvar variable. marker ( $1, \ldots$ ) refers to the marker associated with the first yvar, marker $(2, \ldots)$ refers to the marker associated with the second, and so on. A particularly useful marker_option is mcolor (colorstyle), which sets the color and opacity of the marker. For instance, you might specify marker(1, mcolor (green)) to make the marker associated with the first yvar green. See [G-4] colorstyle for a list of color choices, and see [G-3] marker_options for information on the other marker_options.
pcycle(\#) specifies how many variables are to be plotted before the pstyle (see [G-4] pstyle) of the markers for the next variable begins again at the pstyle of the first variable-p1dot (with the markers for the variable following that using p2dot and so on). Put another way, \# specifies how quickly the look of markers is recycled when more than \# variables are specified. The default for most schemes is pcycle(15).
linetype (dot), linetype(line), and linetype (rectangle) specify the style of the line.
linetype (dot) is the usual default. In this style, dots are used to fill the line around the marker:
linetype(line) specifies that a solid line be used to fill the line around the marker:
linetype (rectangle) specifies that a long "rectangle" (which looks more like two parallel lines) be used to fill the area around the marker:

```
======== 0=======
```

ndots(\#) and dots (marker_options) are relevant only in the linetype (dots) case.
ndots(\#) specifies the number of dots to be used to fill the line. The default is ndots(100).
dots (marker_options) specifies the marker symbol, color, and size to be used as the dot symbol. The default is to use dots(msymbol(p)). See [G-3] marker_options.
lines(line_options) is relevant only if linetype(line) is specified. It specifies the look of the line to be used; see [G-3] line_options.
rectangles(area_options) and rwidth (size) are relevant only if linetype(rectangle) is specified.
rectangles (area_options) specifies the look of the parallel lines (rectangle); see
[G-3] area_options.
rwidth (size) specifies the width (height) of the rectangle (the distance between the parallel lines). The default is usually rwidth (.45); see [G-4] size.
noextendline and extendline are relevant in all cases. They specify whether the line (dots, a line, or a rectangle) is to extend through the plot region margin and touch the axes. The usual default is extendline, so noextendline is the option. See [G-3] region_options for a definition of the plot region.
lowextension(size) and highextension(size) are advanced options that specify the amount by which the line (dots, line or a rectangle) is extended through the axes. The usual defaults are lowextension(0) and highextension(0). See [G-4] size.

## legending_options

legend_options allows you to control the legend. If more than one yvar is specified, a legend is produced. Otherwise, no legend is needed because the over () groups are labeled on the categorical $x$ axis. See [G-3] legend_options.
nolabel specifies that, in automatically constructing the legend, the variable names of the yvars be used in preference to "mean of varname" or "sum of varname", etc.
yvaroptions (over_subopts) allows you to specify over_subopts for the yvars. This is seldom specified.
showyvars specifies that, in addition to building a legend, the identities of the yvars be shown on the categorical $x$ axis. If showyvars is specified, it is typical to also specify legend(off).

## axis_options

yalternate and xalternate switch the side on which the axes appear. yalternate moves the numerical $y$ axis from the bottom to the top; xalternate moves the categorical $x$ axis from the left to the right. If your scheme by default puts the axes on the opposite sides, yalternate and xalternate reverse their actions.
exclude 0 specifies that the numerical $y$ axis need not be scaled to include 0 .
yreverse specifies that the numerical $y$ axis have its scale reversed so that it runs from maximum to minimum.
axis_scale_options specify how the numerical $y$ axis is scaled and how it looks; see
[G-3] axis_scale_options. There you will also see option xscale() in addition to yscale(). Ignore xscale(), which is irrelevant for dot plots.
axis_label_options specify how the numerical $y$ axis is to be labeled. The axis_label_options also allow you to add and suppress grid lines; see [G-3] axis_label_options. There you will see that, in addition to options ylabel(), ytick(), ymlabel(), and ymtick(), options xlabel(),..., xmtick() are allowed. Ignore the $\mathrm{x} *()$ options, which are irrelevant for dot charts.
ytitle() overrides the default title for the numerical $y$ axis; see [G-3] axis_title_options. There you will also find option xtitle() documented, which is irrelevant for dot charts.

## title_and_other_options

text () adds text to a specified location on the graph; see [G-3] added_text_options. The basic syntax of text () is
text $\left(\#_{y} \#_{x}\right.$ "text")
text () is documented in terms of twoway graphs. When used with dot charts, the "numeric" $x$ axis is scaled to run from 0 to 100 .
yline() adds vertical lines at specified $y$ values; see [G-3] added_line_options. The xline() option, also documented there, is irrelevant for dot charts. If your interest is in adding grid lines, see [G-3] axis_label_options.
aspect_option allows you to control the relationship between the height and width of a graph's plot region; see [G-3] aspect_option.
std_options allow you to add titles, control the graph size, save the graph on disk, and much more; see [G-3] std_options.
by (varlist, ...) draws separate plots within one graph; see [G-3] by_option.

## Suboptions for use with over() and yvaroptions()

relabel (\# "text" ...) specifies text to override the default category labeling. See the description of the relabel () option in [G-2] graph bar for more information about this very useful option.
label (cat_axis_label_options) determines other aspects of the look of the category labels on the $x$ axis. Except for label(labcolor()) and label(labsize()), these options are seldom specified; see [G-3] cat_axis_label_options.
axis(cat_axis_line_options) specifies how the axis line is rendered. This is a seldom specified option. See [G-3] cat_axis_line_options.
gap (\#) and gap(*\#) specify the gap between the lines in this over() group. gap(\#) is specified in percentage-of-bar-width units. Just remember that gap(50) is a considerable, but not excessive width. gap(*\#) allows modifying the default gap. gap(*1.2) would increase the gap by $20 \%$, and $\operatorname{gap}(* .8)$ would decrease the gap by $20 \%$.
sort (varname), sort(\#), and sort ((stat) varname) control how the lines are ordered. See How bars are ordered and Reordering the bars in [G-2] graph bar.
sort (varname) puts the lines in the order of varname.
sort(\#) puts the markers in distance order. \# refers to the yvar number on which the ordering should be performed.
sort ( (stat) varname) puts the lines in an order based on a calculated statistic.
descending specifies that the order of the lines-default or as specified by sort() -be reversed.

## Remarks and examples

Remarks are presented under the following headings:

```
Relationship between dot plots and horizontal bar charts Examples
Appendix: Examples of syntax
```

## Relationship between dot plots and horizontal bar charts

Despite appearances, graph hbar and graph dot are in fact the same command, meaning that concepts and options are the same:

```
. graph hbar y, over(group)
```

- graph dot y, over (group)

There is only one substantive difference between the two commands: Given multiple yvars, graph hbar draws multiple bars:
. graph hbar y1 y2, over (group)

graph dot draws multiple markers on single lines:
. graph dot y1 y2, over (group)

The way around this problem (if it is a problem) is to specify option ascategory or to specify option linegap(\#). Specifying ascategory is usually best.

Read about graph hbar in [G-2] graph bar.

## Examples

Because graph dot and graph hbar are so related, the following examples should require little by way of explanation:

```
. use https://www.stata-press.com/data/r18/nlsw88
(NLSW, 1988 extract)
. graph dot wage, over(occ, sort(1))
    ytitle("")
    title("Average hourly wage, 1988, women aged 34 to 46", span)
    subtitle(" ")
    note("Source: }1988\mathrm{ data from NLS, U.S. Dept. of Labor,
        Bureau of Labor Statistics", span)
```

Average hourly wage, 1988, women aged 34 to 46

Source: 1988 data from NLS, U.S. Dept. of Labor, Bureau of Labor Statistics
. graph dot (p10) wage (p90) wage,
over (occ, sort(2))
legend(label(1 "10th percentile") label(2 "90th percentile"))
title("10th and 90th percentiles of hourly wage", span)
subtitle("Women aged 34 to 46 , 1988" " ", span)
note("Source: 1988 data from NLS, U.S. Dept. of Labor, Bureau of Labor Statistics", span)

10th and 90th percentiles of hourly wage
Women aged 34 to 46, 1988

[^0]```
graph dot (mean) wage,
    over(occ, sort(1))
    by(collgrad,
        title("Average hourly wage, 1988, women aged 34 to 46", span)
        subtitle(" ")
        note("Source: 1988 data from NLS, U.S. Dept. of Labor,
                Bureau of Labor Statistics", span)
    )
```

Average hourly wage, 1988 , women aged 34 to 46

Source: 1988 data from NLS, U.S. Dept. of Labor, Bureau of Labor Statistics

## Appendix: Examples of syntax

Let us consider some graph dot commands and what they do:
graph dot revenue
One line showing average revenue.
graph dot revenue profit
One line with two markers, one showing average revenue and the other average profit. graph dot revenue, over(division)
\#_of_divisions lines, each with one marker showing average revenue for each division.
graph dot revenue profit, over(division)
\#_of_divisions lines, each with two markers, one showing average revenue and the other average profit for each division.
graph dot revenue, over(division) over (year)
\#_of_divisions $\times$ \#_of_years lines, each with one marker showing average revenue for each division, repeated for each of the years. The grouping would look like this (assuming 3 divisions and 2 years):

graph dot revenue, over(year) over(division)
Same as above, but ordered differently. In the previous example, we typed over(division) over (year). This time, we reverse it:

graph dot revenue profit, over(division) over (year)
\#_of_divisions $\times$ \#_of_years lines each with two markers, one showing average revenue and the other showing average profit for each division, repeated for each of the years.
graph dot (sum) revenue profit, over(division) over (year)
\#_of_divisions $\times$ \#_of_years lines each with two markers, the first showing the sum of revenue and the second showing the sum of profit for each division, repeated for each of the years.
graph dot (median) revenue profit, over (division) over (year)
\#_of_divisions $\times$ \#_of_years lines each with two markers showing the median of revenue and median of profit for each division, repeated for each of the years.
graph dot (median) revenue (mean) profit, over (division) over (year)
\#_of_divisions $\times$ \#_of_years lines each with two markers showing the median of revenue and mean of profit for each division, repeated for each of the years.
