

**stteffects** — Treatment-effects estimation for observational survival-time data

[Description](#)   [Syntax](#)   [Also see](#)

## Description

`stteffects` estimates average treatment effects, average treatment effects on the treated, and potential-outcome means using observational survival-time data. The available estimators are regression adjustment, inverse-probability weighting, and more efficient methods that combine regression adjustment and inverse-probability weighting.

For a brief description and example of each estimator, see *Remarks and examples* in [\[TE\] stteffects intro](#).

## Syntax

```
stteffects subcommand ... [ , options ]
```

<i>subcommand</i>	Description
<a href="#">ra</a>	regression adjustment
<a href="#">ipw</a>	inverse-probability weighting
<a href="#">ipwra</a>	inverse-probability-weighted regression adjustment
<a href="#">wra</a>	weighted regression adjustment
